

Case ALHYDRAN: Chronical wound

1. Case study description

patient age	79 years
gender	female
cause	open fracture luxation, right ankle with osteosynthesis material post operation, a chronical wound developed
treatment to wound closure	- curettage and hydrogel on wound - wound borders with ALHYDRAN
therapy after care	ALHYDRAN

2. Evolution of the wound

© ZNA for BAP Medical

Post operation removal of OS material. Irritation around the wound.
Treatment: Hydrogel in the wound, ALHYDRAN around the wound.

© ZNA for BAP Medical

3 days before curettage of the wound

© ZNA for BAP Medical

3 days after curettage of the wound

© ZNA for BAP Medical

10 days after curettage and treatment with ALHYDRAN

3. Conclusions medical team

- After luxation fracture and the operation with osteosynthesis material, the wound had never been closed
- Due to the presence of the characteristics of a chronical wound with underlying OS material, there is a big chance of deeper infections and the wound will be very difficult to close
- OS material was removed laterally
- The wound borders have improved significantly due to treatment with ALHYDRAN
- In the after care only ALHYDRAN was used
